1.0 INTRODUCTION

The commercial treatment/recovery capacity data set consists of data on Incineration/Reuse as Fuel and on Other Treatment Systems. System capacity data derived from data reported in the National Survey of Hazardous Waste Treatment, Storage, Disposal and Recycling Facilities (TSDR Survey) were entered onto PC data entry sheets. The purpose of these forms was to collect and standardize information required for assessing available treatment capacity that was to be obtained from the TSDR survey and entered into a commercial treatment/recovery data base. Blank PC data entry sheets, along with a detailed discussion of their use, may be found in Procedures for Completing PC Data Sheets for Priority TSDR Facilities located in this docket.

As with the TSDR Survey Waste Volumes Land Disposed Data Set, the dBase language was chosen for creating a data entry system. The data entry system in dBase could be developed fairly quickly, could be installed on nearly any PC computer (no special requirements), was relatively easy to teach to data entry operators, aided the data entry staff in getting information in the correct fields and was compatible with the desired reporting language.

PC SAS was chosen for the reporting language. Among the requirements for the project were (1) to keep the Confidential Business Information (CBI) on a secure machine and (2) to have the data available for a variety of reporting tasks including statistical analysis. The only quickly available alternative for a final data language was PC FOCUS. The FOCUS language would have been preferred in some areas because of how

it maintains data relationships. The SAS language, however, had the advantage of being extremely flexible and easily changed, which has proven to be highly important given the changing nature of the source data. Other advantages of SAS are the speed with which it was able to implement the system, the lack of dependence on data structure for creating new reports, the number of options available for modular code and passing parameters to subroutines, and its interface to the chosen data entry system.

2.0 INCINERATION/REUSE AS FUEL DATA SET

The data set was generated by review and engineering evaluation of TSDR Survey responses, transfer of data in the questionnaires to computer data entry sheets, entering of data in a PC data base, and final consolidation of all facility capacities to arrive at national totals. The data base contains data entry fields as well a calculated fields used to perform the capacity analysis.

The questionnaires pertaining to incineration and reuse as fuel in the TSDR Survey were Questionnaire B, "Incineration," and Questionnaire C, "Reuse as Fuel," respectively. A copy of the two questionnaires can be found in the docket for this proposed rule. The questionnaires were designed to provide not only actual utilization and maximum capacity data by the facility but also other design and operational information to allow the reviewer to evaluate the accuracy of the facility responses. These other data elements were:

- Operating/downtime information;
- Percent utilization;
- Maximum practical thermal rating;

- Average heating value of the hazardous and nonhazardous waste being treated;
- Maximum practical feed rate for each waste form;
- Planned capacity increases/decreases by time period;
- Type of solids that can be fed to the unit; and
- Waste characteristics that exclude or limit acceptance for treatment.

The reviewer used the above information to evaluate the validity of the facility responses to utilized and maximum capacity questions and to determine if additional maximum capacity was available over and above what the facility had reported. If additional capacity was apparent, the reviewer contacted the facility by telephone to verify his or her findings, and, if agreeable to the facility, adjusted the data entries on the survey booklets. The PC data sheets were then completed using the most representative information for the respective faciliy.

The types of units considered in the Incineration/Reuse as Fuel spread sheet are as follows:

- Liquid injection;
- Rotary (or rocking) kiln;
- Rotary kiln with liquid injection;
- Two-stage;
- Fixed hearth;
- Multiple hearth;
- Fluidized bed;
- Infra-red;
- Fume/vapor;
- Pyrolytic destructor;
- Cement kiln;
- Aggregate kiln;
- Asphalt kiln;
- Fuller's Earth kiln;
- Sulfur recovery furnace;
- Industrial boiler;
- Utility boiler;
- Process heater; and
- Sulfuric acid regeneration furnace.

The Incineration data includes only commercial treatment facilities, as opposed to private or limited commercial facilities. Limited commercial facilities are those that accept wastes only from one client or from a limited number of clients. In the cases of facilities that reuse hazardous waste as fuel, data is included from both commercial and limited commercial facilities, since many of these facilities are limited commercial (survey response) because they accept hazardous waste from fuel blenders and waste brokers. Because these blenders and brokers are fully commercial, the facilities that reuse as fuel hazardous waste obtained from these facilities were considered commercial.

The data set consisted of a CBI (Confidential Business Information) and a non-CBI data. To protect the confidentiality of the CBI facilities, the capacity analysis results for the CBI facilities were incorporated in the summary numbers to arrive at national totals but have not been presented in the facility specific data.

The following fields are contained in the Incineration/Reuse as Fuel spread sheet:

- Facility ID: The USEPA identification number for the facility.
- Facility Name.
- Unit No.: The unit number(s) of each incinerator or kiln. Some facilities have more than one incinerator or kiln.
- Commercial status: The two commercial categories used for this data set are (1) commercial - accepts waste from the general public and (2) accepts waste from a limited number of facilities not under the same ownership (limited commercial).
- Unit type: A code to identify the various types of units as described earlier.

- Fixed or Mobile unit (F/M): An "F" represents a fixed unit at a permanent location, as opposed to a mobile unit or "M."

- Exempt (Y/N): RCRA permit status. A "Y" indicates that the unit is exempt from RCRA permitting and operating regulations.

- Thermal* Rating, MBtu/hr: A measure of the amount of usable heat input that can be generated by the unit to burn waste.

- Waste Feed Mix (Y/N)

  - Liquid: A "Y" indicates that unit can accept liquids for treatment.
  - Sludge: A "Y" indicates that unit can accept sludges for treatment.
  - Solid: A "Y" indicates that unit can accept solid for treatment.
  - Gases: A "Y" indicates that unit can accept gases for treatment.

- Unique (Y/N): A "Y" indicates that the unit has special applications or limitations.

- Comments: This field lists the above-referenced applications or limitations that make the unit unique.

- 1986 Utilized Quantities (All quantities entered in gallons)

  - Hazardous Waste Quantity: This amount represents the quantity of RCRA hazardous waste treated in the subject unit during calendar year 1986. This quantity is also referred to as utilized capacity. There are four separate fields for each possible waste form: liquids, sludges, solids, and gases.

  - Nonhazardous Waste Quantity: This is the quantity of nonhazardous waste that was treated in the same unit, either concurrently or separately, during 1986. Each waste form described above is included.

  - Utilized Capacity: The utilized capacity is a calculated field. If the hazardous waste maximum system capacity was less than the all waste maximum system capacity, the utilized capacity is equal to the 1986 hazardous waste quantity; otherwise, the utilized capacity is equal to the total of the 1986 hazardous and nonhazardous waste quantities.

- 1986, 1987, 1988, 1989-90, and 1991-92 Hazardous Waste Maximum Capacity: Data were entered directly from the PC data sheets. All quantities were entered in gallons.

- 1986, 1987, 1988, 1989-90, and 1991-92 All Waste Maximum Capacity: Data were entered directly from the PC data sheets. All quantities were entered in gallons.

- Available Capacity: The available capacity is a calculated field. This quantity was calculated for each year (1986 through 1991-92) for each waste form (liquids, sludges, solids, and gases). The field for each waste form was calculated for the respective year (1986 through 1991-92) by the following algorithm. If the hazardous waste maximum capacity is less than the all waste maximum capacity, the available capacity is equal to the hazardous waste maximum capacity minus the 1986 hazardous waste utilized quantity; otherwise, the available capacity is equal to the hazardous waste maximum capacity minus the total of the 1986 hazardous and nonhazardous utilized quantities.

The following discussion presents the results of the incineration/reuse as fuel data set.

3.0 INCINERATION/REUSE AS FUEL DATA SET SUMMARY

Table 3-1 summarizes the commercial capacity for hazardous waste incineration. This table presents the utilized, maximum, and available capacity for incineration of liquids, sludges, sol s, and gases in 1986, and the maximum and available capacity for 1987, 1988, 1989-90, and 1991-92. The analysis assumes that hazardous waste capacity not utilized in 1986 and all new hazardous waste capacity from 1987 and beyond will be available for incineration of hazardous wastes. Table 3-2 is a list of all the commercial facilities currently included in the data base, with individual unit information, and Table 3-3 presents the capacities of each non-CBI unit.

Table 3-1 Summary of Commercial Hazardous Waste Incineration Capacity (Million Gallons/Year)

Physical form of waste	1986			1987		1988		1989-1990		1991-1992	
	Utilized capacity	Maximum capacity	Available capacity	Maximum capacity	Available capacity[a]	Maximum capacity	Available capacity[a]	Maximum capacity	Available capacity[a]	Maximum capacity	Available capacity[a]
Liquids	63	81	18	101	38	132	69	325	262	325	262
Sludges	3	8	5	8	5	14	11	109	106	109	106
Solids	18	28	10	28	10	50	33	194	176	194	176
Gases	0	1	1	2	2	3	3	3	3	3	3
	—	—	—	—	—	—	—	—	—		
TOTAL	84	119	35	139	55	208	126	631	547	631	547

Source: TSDR Survey results as of April 1989.

[a] Projected based on maximum capacity for that year minus utilized capacity for 1986. This considers that capacity not utilized in 1986 and all new capacity (from 1987 and beyond) will be available for incineration of hazardous wastes being land disposed that may be affected by the land disposal restrictions.

Table 3-2 List of Commercial Facilities with Incinerators

Facility name/address	EPA ID#	No. of units	Type of unit	Thermal rating (MBtu/hr)	Waste feed capability	Operating status	Permit status
1. Alchem-Iron, Inc. (Division of GSX) Cleveland, Ohio	OHD980569438	1	Infrared w/secondary combustion chamber	30	Sludges and solids	In place but not operating until early 1989	RCRA permit application under review.
2. Aptus Environmental Services Coffeeville, KS	KSD981506025	1	Rotary kiln w/liquid injection	62	Liquids and solids	Currently burning	TSCA permitted
3. BDI, Inc. Clarence, New York	NYD000632372	1	Fixed hearth with secondary combustion chamber	2	Solids	Currently burning	RCRA permit granted
4. BI/Cecos West Point Facility Louisville, KY	KYD079661146	1	Rotary kiln w/liquid injection	131	Liquids, sludges, and solids	Planned for 1989 to 1990	RCRA permit application under review
5. Caldwell Systems, Inc. Lenoir, North Carolina	NCD086871282	1	Liquid injection	14	Liquids	Currently burning	RCRA interim status
6. Chemical Waste Management Incineration Division Sauget, Illinois	ILD098642424	2	Fixed hearth	14 16	Liquids, sludges, and solids	Currently burning	RCRA interim status
7. Chemical Waste Management, Inc. Port Arthur, Texas	TXD000838896	1	Rotary kiln w/liquid injection	150	Liquids, sludges, and solids	Planned 1989 1990	RCRA permit application under review
8. Environmental Systems Co. El Dorado, Arkansas	ARD069748192	2	Rotary kiln w/liquid injection	170 36	Liquids, sludges, and solids	Currently burning Planned 1988	RCRA interim status and TSCA permit for PCBs
9. Envirosafe Services of Texas Devers, TX	TSD980748107	2	Rotary kilns w/liquid injection	100 each	Both accept liquids, sludges, and solids	Both planned for 1989 1990	RCRA permit applications under review

CBI - Confidential business information.

NA - Not available at this time.

[a] A pyrolytic destructor is not considered an incinerator, but is a thermal treatment unit that is included in the incinerator questionnaire for the TSDR Survey for data gathering/analysis purposes.

[b] A deflagrating reactor is also not considered an incinerator, but is a thermal treatment unit used for destruction of explosive wastes. It is included in the incinerator questionnaire of the TSDR Survey for data gathering/analysis purposes.

[c] Facility has stopped accepting wastes based on a recent telephone contact.

Table 3-4 summarizes the commercial capacity of facilities that reuse hazardous waste as fuel. The table presents the utilized, maximum, and available capacity for combustion of liquids, sludges, and solids as fuel in 1986, and maximum and available capacity for 1987, 1988, 1989-90, and 1991-92. Again, the analysis assumes that hazardous waste capacity not utilized in 1986 and all new hazardous waste capacity from 1987 and beyond will be available for combustion of hazardous wastes. Table 3-5 lists the commercial reuse as fuel facilities currently included in the data base, with individual unit information, and Table 3-6 presents the capacities of each non-CBI unit.

Table 3-4 Summary of Commercial Capacity for Reuse of Hazardous Waste as Fuel (Million Gallons/Year)

Physical form of waste	1986 Utilized capacity	1986 Maximum capacity	1986 Available capacity	1987 Maximum capacity	1987 Available capacity[a]	1988 Maximum capacity	1988 Available capacity[a]	1989-1990 Maximum capacity	1989-1990 Available capacity[a]	1991-1992 Maximum capacity	1991-1992 Available capacity[a]
Liquids	97	361	264	388	291	367	271	606	509	606	509
Sludges	<1	<1	<1	1	1	2	2	38	38	38	38
Solids	<1	1	1	1	1	2	1	2	2	2	2
TOTAL	97	362	265	390	293	371	274	646	549	646	549

Source: TSDR Survey results as of April 1989.

NOTE: For cases where capacity was added to existing units or new units were added, all facilities indicated that new capacity would be available 100 percent for hazardous waste.

[a] Projected based on maximum capacity for that year minus utilized capacity for 1986. This considers that capacity not utilized in 1986 and all new capacity (from 1987 and beyond) will be available for burning (reuse as fuel) of hazardous wastes being land disposed that may be affected by the land disposal restrictions.

5778s

Table 3-5 List of Commercial Facilities That Reuse Hazardous Waste as Fuel

Facility name/address	EPA ID#	No. of units	Type of kiln	Thermal rating (MBtu/hr)	Waste feed capability	Operating status	Permit status
1. Allied Chemical Corporation Ironton, OH	OHD043730217	1	Industrial boiler	80	Liquids, sludges, and solids	Planned for 1989-1990	Will apply for RCRA permit
2. American Chemical Service, Inc. Griffith, IN	IND016360265	1	Industrial boiler	12	Liquids only	Currently burning	RCRA interim status
3. American Resource Recovery Corporation Memphis, TN	TND991279480	2	Industrial boilers	6, 5	Liquids and sludges	Currently operating	Both exempt
4. Ash Grove - Cadence Louisville, Nebraska	NED007260672	1 1	Cement kiln Cement kiln	NA NA	Liquids, some sludge[a]	Currently burning Planned 1988	Exempt
5. Ash Grove - Chanute Chanute, KS	KSD031203318	2	Cement kilns	176 (each)	Liquids	Currently burning	RCRA permit application under review
6. Ash Grove - Foreman Cement Foreman, Arkansas	ARD981512270	3	Cement kilns	260; 390	Liquids only	Currently burning	RCRA interim status
7. Blue Circle Atlantic Cement Co. Ravena, New York	NYD002069557	2	Cement kilns	585 (each)	Liquids only	Planned 1989-1990	NA
8. Carolina Solite Albemarle, North Carolina	NCD003152642	4	Aggregate kilns	35 (each)	Liquids	All currently operating	Exempt
9. Central Missouri Paving Co., Inc. Moberly, MO	MOD046381445	1	Asphalt kiln	100	Liquids only	Currently burning	Exempt
10. Coplay Cement Co. Logansport, Indiana	IND005081542	2	Cement kilns	165 (each)	Liquids, sludges	Operational in 1987	RCRA permit application under review

4.0 OTHER TREATMENT SYSTEMS DATA SET

PC data entry forms were filled out for commercial other treatment systems, and the data were entered into the commercial treatment/recovery data base. The data base contains data entry fields as well as calculated fields used to perform the capacity analysis.

The following fields are contained in the data base:

- Facility ID: Data entered from PC data sheets.
- System Description: A general description of the system based on the codes given on the PC data sheets for unit type(s).
- Commercial Status: Commercial status code(s) entered from the PC data sheets. The classifications include commercial (manages waste from any facility), limited commercial (manages waste from a limited number of facilities not under same ownership), captive (only manages waste from facilities under the same ownership), and onsite or private (only manages waste generated on-site).
- Solidification/Stabilization: A "Y" answer in this field indicates that the facility has this proces
- Solvent/Liquid Recovery: A "Y" answer in t is field indicates that the facility has this process.
- Metals Recovery: A "Y" answer in this field indicates that the facility has this process.
- Wastewater Treatment: A "Y" answer in this field indicates that the facility has this process.
- Other Process (Treatment/Recovery): A "Y" answer in this field indicates that the facility has this process.
- Comments: Comments provided by the survey respondent or technical reviewer regarding any important or unique restriction or aspect of the treatment/recovery system were entered into this field.
- Unit Types in System: Data entered directly from the PC data sheets. The unit types in the system are represented by the process codes provided in the TSDR Survey.

- 1986 Hazardous Waste Quantity: The amount of hazardous waste treated by the system in 1986. Data entered directly from the PC data sheets. If the quantity was given in tons, the units were converted to gallons.

- 1986 Nonhazardous Waste Quantity: The amount of nonhazardous waste treated by the system in 1986. Data entered directly from the PC data sheets. If the quantity was given in tons, the units were converted to gallons.

- 1986, 1987, 1988, 1989-90, and 1991-92 Hazardous Maximum Proportioned System Capacity: Data entered directly from the PC data sheets. This quantity was derived from the TSDR Survey data as described in Section 4.3.2. If the quantity was given in tons, the units were converted to gallons.

- 1986, 1987, 1988, 1989-90, and 1991-92 Hazardous Waste Maximum System Capacity: Data entered directly from the PC data sheets. This quantity was derived from the TSDR Survey data as described in Section 4.3.2. If the quantity was given in tons, the units were converted to gallons.

- 1986, 1987, 1988, 1989-90, and 1991-92 All Waste Maximum System Capacity: Data entered directly from the PC data sheets. This quantity was derived from the TSDR Survey data as described in Section 4.3.2. If the quantity was given in tons, the units were converted to gallons.

- 1986, 1987, 1988, 1989-90, and 1991-92 All Waste Maximum Proportioned System Capacity: Data entered directly from the PC data sheets. This quantity was derived from the TSDR Survey data as described in Section 4.3.2. If the quantity was given in tons, the units were converted to gallons.

- 1986, 1987, 1988, 1989-90, and 1991-92 Available Capacity: The available capacity is a calculated field. If the hazardous waste maximum system capacity for the year was less than the all waste maximum system capacity for the year, then the available capacity was calculated to be the difference between the hazardous waste maximum system capacity for the year and the value given for the 1986 hazardous waste quantity (hazardous waste utilized capacity). Otherwise, the available capacity was calculated to be the difference between the all waste maximum system capacity for the year and the sum of the hazardous and nonhazardous waste quantities for 1986 (all waste utilized capacity).

- 1986, 1987, 1988, 1989-90, and 1991-92 Proportioned Available Capacity: The proportioned available capacity is a calculated field. If the hazardous waste maximum proportioned system capacity for the year was less than the all waste maximum proportioned system capacity for the year, then the available capacity was calculated to be the difference between the hazardous waste maximum proportioned system capacity for the year and the value given for the 1986 hazardous waste quantity (hazardous waste utilized capacity). Otherwise, the available capacity was calculated to be the difference between the all waste maximum system capacity for the year and the sum of the hazardous and nonhazardous waste quantities for 1986 (all waste utilized capacity).

- 1986, 1987, 1988, 1989-90, and 1991-92 Normalized Available Capacity: The available capacity calculation can give a negative number (e.g., if the hazardous waste maximum system capacity for the year is zero) since the utilized capacity value is based on the hazardous and nonhazardous waste quantities for 1986. To account for this, all negative values calculated for the available capacity were set to zero and presented in a separate field as the normalized available capacity.

- 1986, 1987, 1988, 1989-90, and 1991-92 Normalized Proportioned Available Capacity: The proportioned available capacity calculation can give a negative number (e.g., if the hazardous waste proportioned maximum system capacity for the year is zero) since the utilized capacity is based on the hazardous and nonhazardous waste quantities for 1986. To account for this, all negative values calculated for the proportioned available capacity were set to zero and presented in a separate field as the normalized proportioned available capacity.

- 1986, 1987, 1988, 1989-90, and 1991-92 Maximum Capacity: The maximum capacity was calculated for each year using the following reasoning:

  - If the hazardous waste maximum system capacity for the year was equal to zero and the hazardous waste maximum proportioned system capacity for the year was greater than zero, then the hazardous waste maximum proportioned system capacity for the year was reported.

  - If the hazardous waste maximum proportioned system capacity for the year was greater than zero and the hazardous waste maximum proportioned system capacity for the year was less than the hazardous waste maximum system capacity for the year, then the hazardous waste maximum proportioned system capacity for the year was reported.

- If neither of the above conditions was met, then the hazardous waste maximum system capacity for the year was reported.

- Utilized Capacity: The utilized capacity is a calculated field. If the 1986 hazardous waste maximum system capacity was less than the 1986 all waste maximum system capacity or if the 1986 hazardous waste maximum proportioned system capacity was less then the 1986 all waste maximum proportioned system capacity, then the 1986 hazardous waste quantity was reported. Otherwise, the sum of the 1986 hazardous waste and 1986 nonhazardous waste quantities was reported as the utilized capacity. The values for the utilized capacity were used to calculate the available and proportioned available capacities for each year as described above.

- 1986, 1987, 1988, 1989-90, and 1991-92 Final Available Capacity: A final available capacity was calculated for each year using the following reasoning:

  - For 1987, 1988, 1989-90, and 1991-92, if the 1987 (1988, 1989-90, and 1991-92) maximum capacity was less than the 1986 maximum capacity, then the available capacity for the year was equal to the maximum capacity for the year minus the utilized capacity.

  - If the normalized available capacity for the year was equal to zero and the normalized proportioned available capacity for the year was equal to zero, then the normaliz available capacity for the year was reported.

  - If the normalized available capacity for the year was equal to zero and the normalized proportioned available capacity for the year was greater than zero, then the normalized proportioned available capacity for the year was reported.

  - If the normalized available capacity for the year was greater than zero and the normalized proportioned available capacity for the year was equal to zero, then the normalized available capacity for the year was reported.

  - If the normalized available capacity for the year was greater than the normalized proportioned available capacity for the year, then the normalized proportioned available capacity for the year was reported.

  - If none of the above conditions were met, then the normalized available capacity for the year was reported.

- Category: There are four major process categories in the data base, each of which is divided into subcategories. A more detailed discussion of how and why the categories were developed is given below. The categories and subcategories, along with the codes used to represent them within the data base, are listed as follows:

I. Wastewater Treatment

Process	Code
- Cyanide Oxidation	WW, CO
- Chrome Reduction	WW, CR
- Organics/Metals Treatment	WW, OMT
- Organics/Metals Biological Treatment	WW, OMB

Process	Code
- Sulfide Precipitation	WW, SP
- General Chemical Precipitation	WW, GCP
- Steam Stripping	WW, SS
- Air Stripping	WW, AS
- Biological Treatment	WW, BT
- Carbon Adsorption	WW, CA
- General Oxidation	WW, GO
- Wet Air Oxidation	WW, WAO
- Neutralization	WW, N

II. Solvent Recovery

Process	Code
- Thin Film Evaporation	SR, TF
- Fractionation/Distillation	SR, FD
- Solvent Extraction	SR, SE
- Other Solvent Recovery	SR, O

III. Metals Recovery

Process	Code
- High Temperature Metals Recovery	MR, HT
- Retorting	MR, R
- Secondary Smelting	MR, SS
- Other Metals Recovery	MR, OMR

IV. Solidification

Process	Code
- Solidification	SL, S

The maximum, utilized, and available capacities were totaled for all systems in the data base that fell under each category. Each category is mutually exclusive so that the capacity of a treatment system would not be counted twice. The treatment systems were categorized by using the computer to search each record for key unit types (process codes) that would identify the appropriate category under which the system should be placed. For example, records indicating systems with unit types identified by process codes 2WT, 3WT, 4WT, or 5WT, and 10WT through 15WT were categorized under cyanide oxidation. These categories were used because the BDAT program has identified them as treatment methods that may be effective in attaining the treatment standards established under the solvents and dioxins, California List, First Third and Second Third final rulemakings.

5.0 OTHER TREATMENT CAPACITY DATA SET RESULTS

Only a subset of the treatment systems that compose the treatment capacity data set was required by solvents, California List HOCs, First Third wastes, and Second Third wastes. These treatment categories have been identified under the BDAT program as being effective in attaining the applicable treatment standards. Under each category, only commercial treatment systems were aggregated to establish a national supply of available treatment capacity that may be used to meet the demand created by the Land Disposal Restrictions Rule.

Table 5-1 presents the maximum, utilized, and available capacities of commercial treatment systems (other than combustion) of concern for reporting baseline year 1986 and capacity projections through 1992. The 1986 utilized capacities of these treatment systems were assumed to remain constant for the subsequent years in making these projections. Where a linked system exists, the proportioned system capacity for the linked system is used to avoid overestimating available capacity. For commercial treatment systems that closed between 1986 and 1988 or will close in 1989-90 or 1991-92, the utilized capacity of that system remained in the analysis under the assumption that the waste volumes the system was treating will require commercial capacity elsewhere. Keeping the utilized capacity of the closed system in the analysis results in reducing the available commercial capacity for that category.

Table 5-2 lists the non-CBI commercial facilities and their associated system capacities.

Table 5-1 Summary of Commercial Treatment System Capacities (Million Gallons/Year)[a]
